

Comparative Analysis of OMI/OMAERUV and AERONET Retrieval of Single-scattering Albedo in Biomass Burning and Dust Environments

Hiren Jethva^{1,2}, Omar Torres², Changwoo Ahn^{2,3}, Zhong Chen^{2,3}

¹ USRA/GESTAR ²NASA GSFC ³SSAI

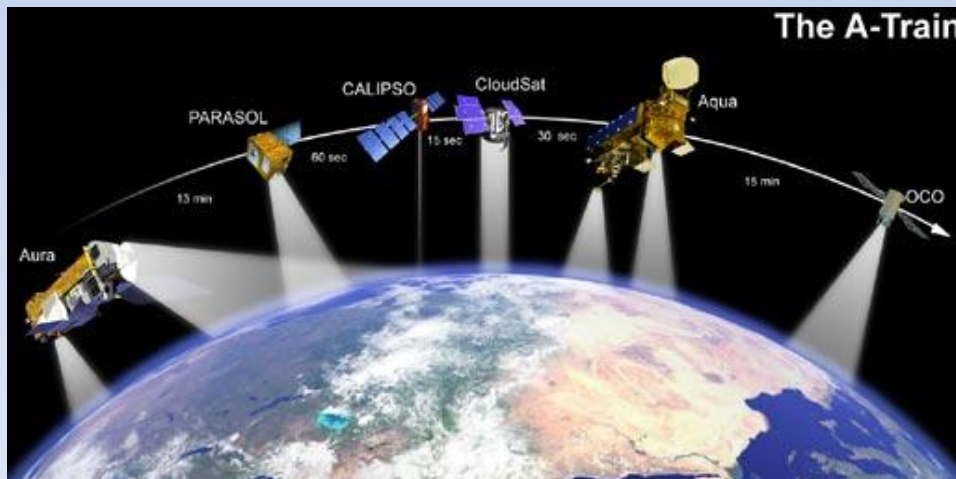

What is OMI?

- A hyper-spectral instrument on board **NASA's AURA** satellite
- **Launch date:** July 15, 2004
- A successor of successful **TOMS** instrument
- **Spectral range:** 270-500 nm
- **Purpose:** To derive Ozone, NO₂, SO₂, BrO, OClO, and **aerosols**
- TOMS+OMI provide longest record on ozone and aerosols

OMI foot print size 13X24 km²

<http://aura.gsfc.nasa.gov/instruments/omi.html>

UV-Aerosol Index

Step 1: Estimation of lambertian equivalent reflectivity at 388

$$I_{388} = I_{0388} + \frac{R_{388}T}{1 - S_b R_{388}}$$

Step 2: Estimation of radiance at 354 assuming LER@388 nm

$$I_{354}^{calc} = I_{0354} + \frac{R_{388}T}{1 - S_b R_{388}}$$

Step 3: Computation of UV-AI

$$UVAI = -100 * \log\left(\frac{I_{354}^{meas}}{I_{354}^{calc}}\right)$$

- Qualitative indicator of elevated absorbing aerosols such as dust and smoke
- Positive AI for absorbing aerosols
- Negative AI for scattering aerosols
- Near-zero AI for clouds
- Used in numerous studies and publications for detection of UV-absorbing aerosols

Near-UV Aerosol Retrieval

Torres et al., (2007), JGR

Spectral measurements of
reflected radiance at TOA
354 nm, 388 nm

Look-up-table

Aerosol types: Smoke, dust, and industrial
Each aerosol type has 7 aerosol models

Layer heights=0.0, 1.5, 3.0, 6.0, 10.0

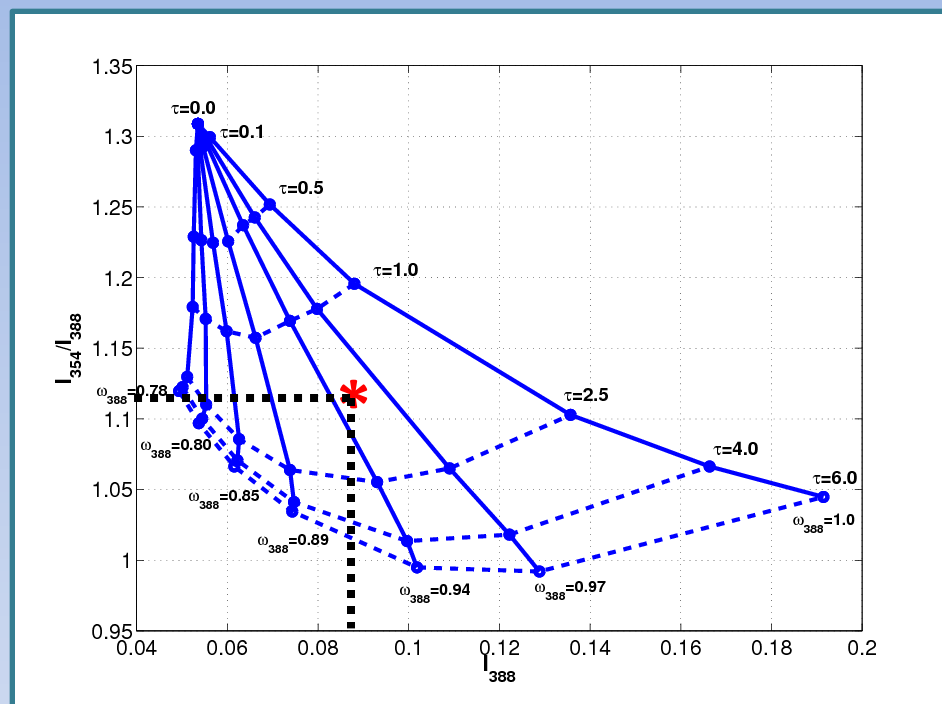

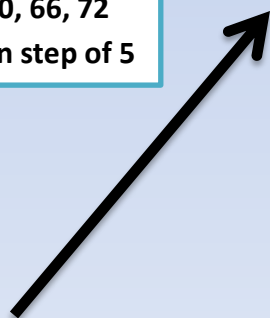

SZA=0, 20, 40, 60, 66, 72, 80

VZA= 0, 12, 18, 26, 32, 36, 40, 46, 50, 54, 56, 60, 66, 72

PHI=0 to 150 in step of 30 and then 160 to 180 in step of 5

Aerosol type selection
Surface albedo
Aerosol layer height

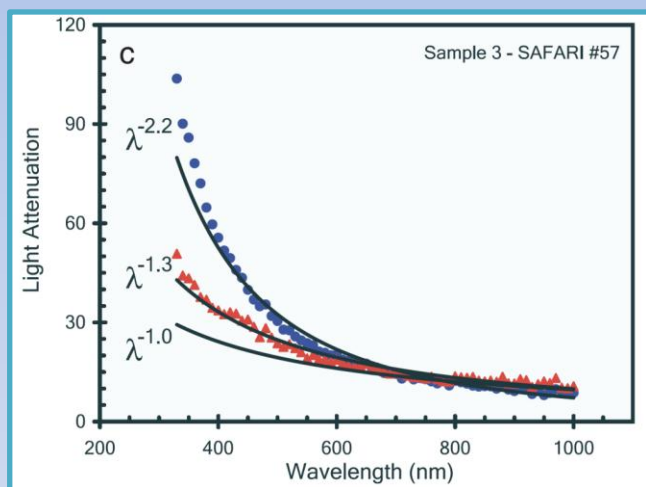

Retrieved Aerosol Parameters
aerosol optical depth,
single-scattering albedo at 388 nm
Converted AOD and SSA at 354 and 500 nm

Recent Changes in the OMAERUV algorithm

1. Updated Carbonaceous aerosol models

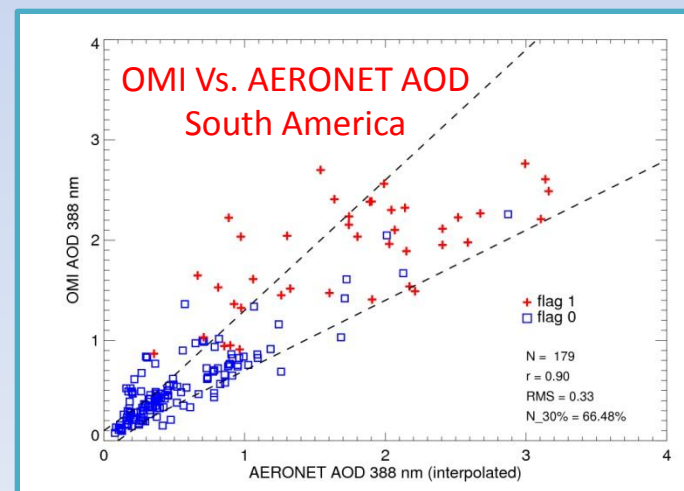

Kirchstetter et al. (2004)

Jethva & Torres, ACP (2011)

Wavelength-dependent imaginary index in the near-UV region is a strong proxy for the presence of organics

Recent Changes in the OMAERUV algorithm

2. Determination of aerosol layer height using CALIOP measurements

- ❑ Use of CALIOP 532 nm aerosol back-scatter profile of extinction in conjunction with OMI UV-AI
- ❑ Cloud-free CALIOP and OMI (UV-AI>1.5) pixels are collocated in time and space
- ❑ Averaging of extinction coef. at each and all levels of collocated CALIOP profiles
- ❑ Derivation of mean aerosol height as extinction coef. weighted averaged profile
- ❑ Record of CALIOP and OMI data used in making of monthly climatology: July 1, 2006 to June 30, 2008 (30 months)

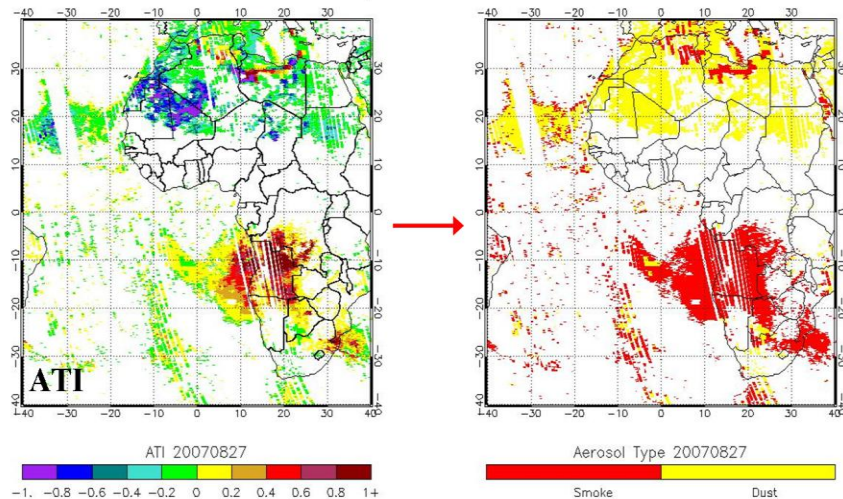

Recent Changes in the OMAERUV algorithm

3. Use of AIRS Carbon Monoxide (CO) and UV-AI for the aerosol type identification

Using AIRS CO data and OMAERUV AI to separate dust-carbonaceous aerosol types

AI can't differentiate dust from smoke; CO is an excellent tracer of carbonaceous aerosols

$ATI = (AI - AI_0)(CO - CO_0) \rightarrow$ Aerosol type Index
 AI_0 and CO_0 ($2.3e18$, NH; $1.8e18$, SH) \rightarrow threshold values

Smoke if $ATI > 0$ and $AI > 0.8$
Dust if $ATI < 0$ and $AI > 0.8$

SMOKE

($AI \geq 0.8$ & $CO > 1.8$ for the S.H) OR
($AI \geq 0.8$ & $CO > 2.2$ for the N.H) OR
($CO > 2.5$ for the S.H) OR
($CO > 2.8$ for the N.H)

DUST

$AI \geq 0.8$ OR (Arid and Semi-Arid surface types)

SULPHATE (if above conditions not satisfied)

Re-processing of OMI Record

- ❖ Entire OMI record (**2004-to-present**) was reprocessed with the updated algorithm.
- ❖ Re-processed retrievals were compared with the AERONET.
- ❖ **This talk: SSA comparison.**
- ❖ For AOD comparison, please refer to [Changwoo's AGU 2011 poster content](#).

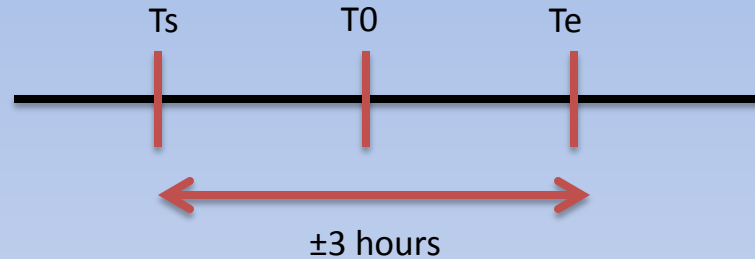

Co-location Methodology

OMI retrieval spatial averaging

OMI Version 1.3.7, Collection 3, Level 2)
Minimum required OMI Pixels = 1

AERONET retrieval temporal averaging

Level 2.0 dataset
Minimum required AERONET measurements = 1

Wavelength conversion:

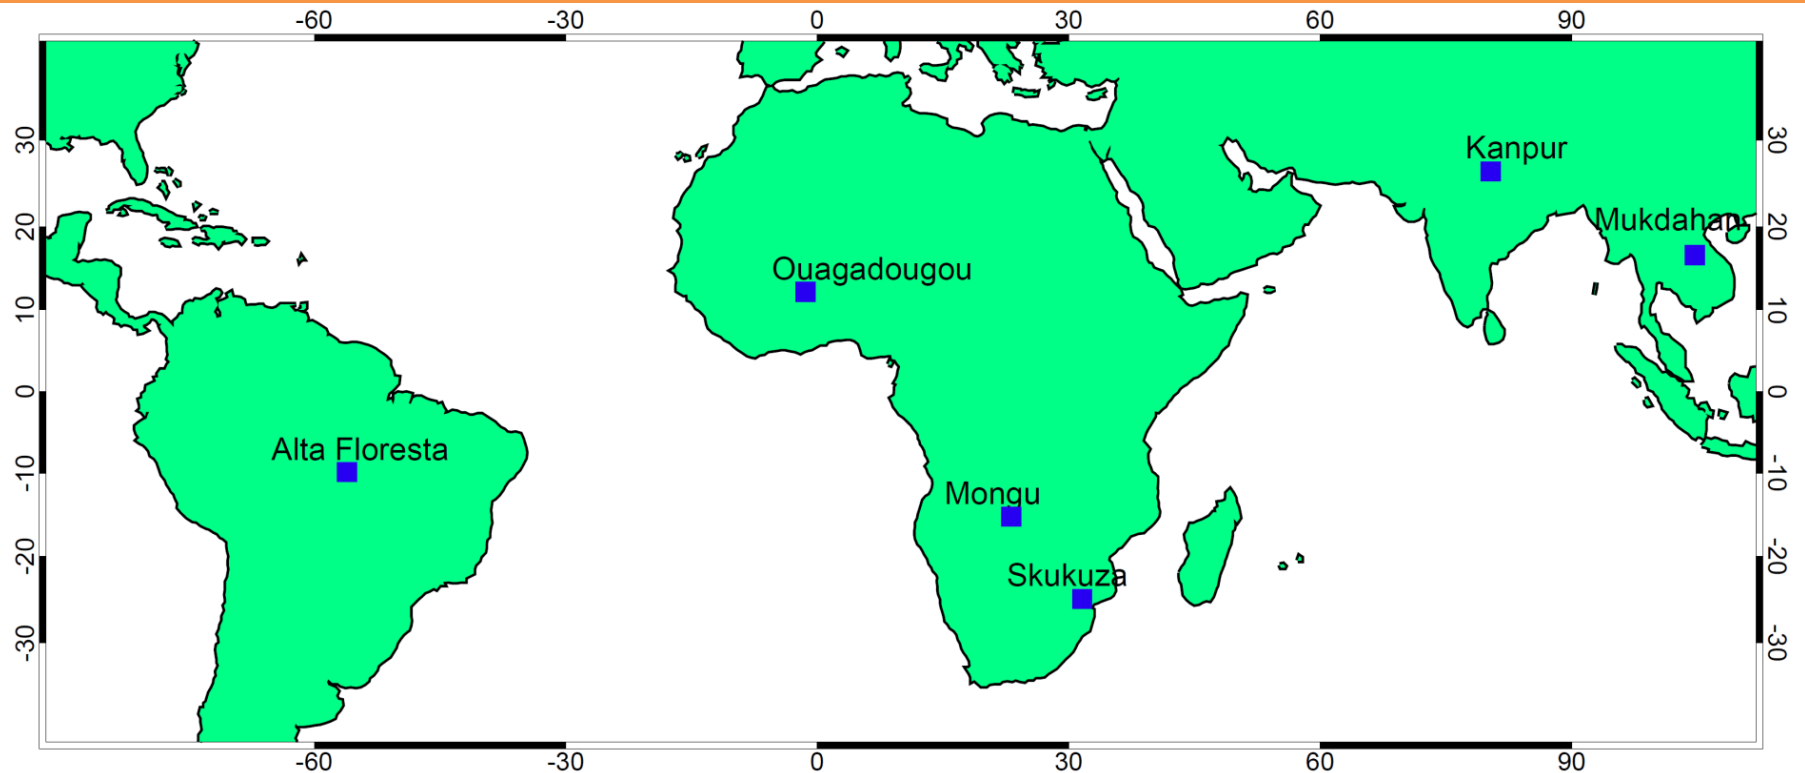

OMI and AERONET derive aerosol absorption at different wavelengths

OMI retrieval at 388 nm, converted to 354 and 388 nm

AERONET retrievals at 440 , 670, 870, 1020 nm

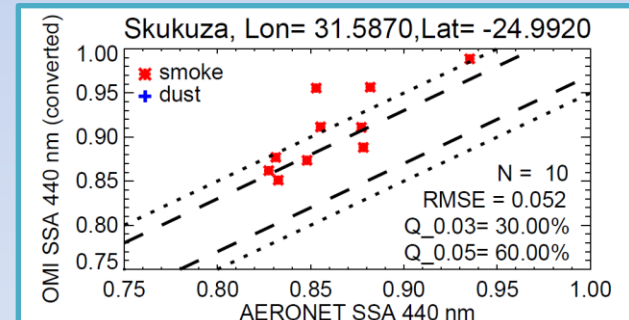

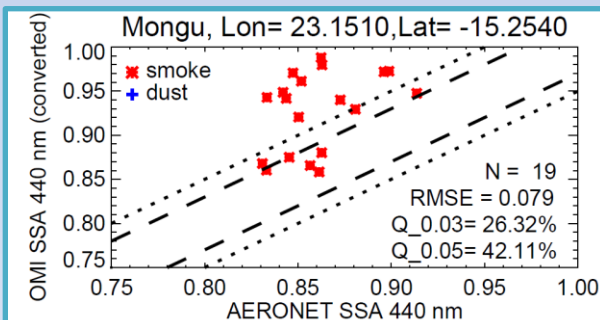

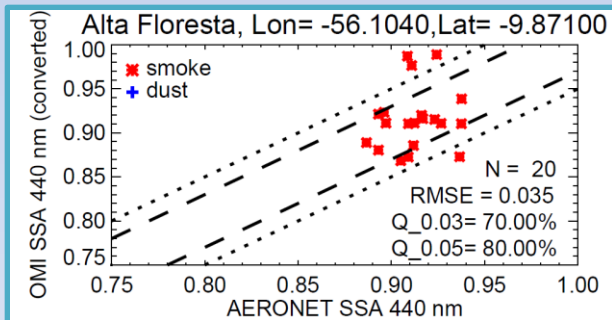

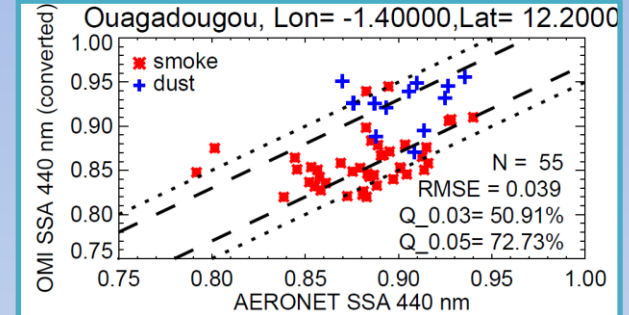

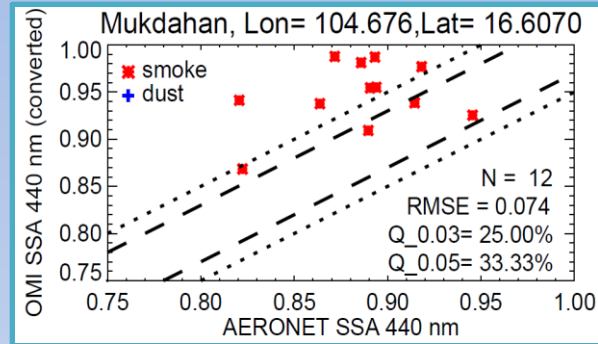

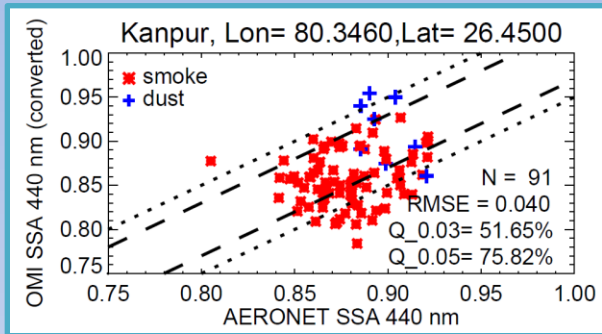

OMI SSA interpolated to 440 nm ↔ AERONET retrievals at 440 nm

Biomass Burning Sites

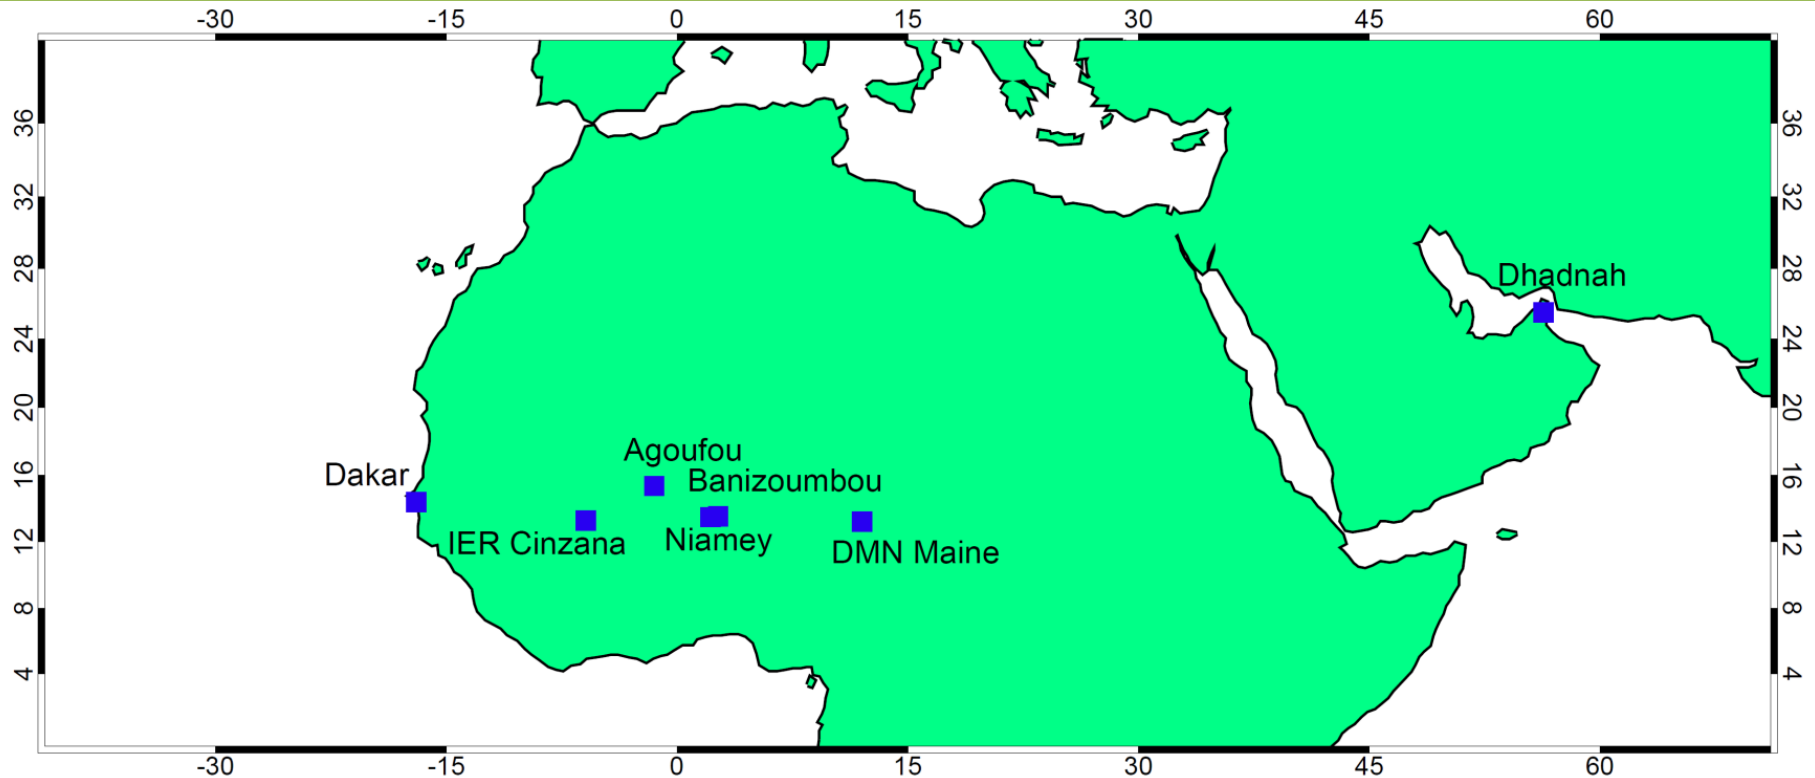

OMI Vs. AERONET

Biomass Burning Sites

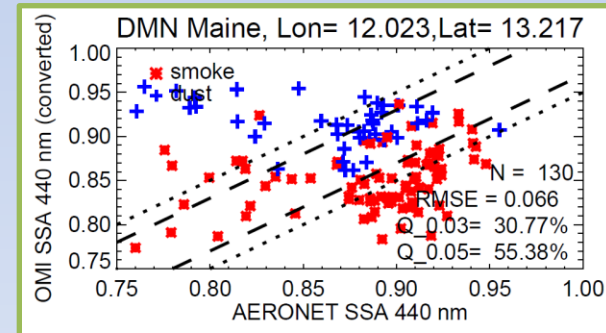

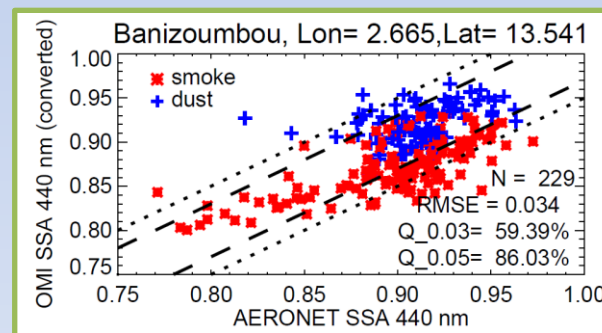

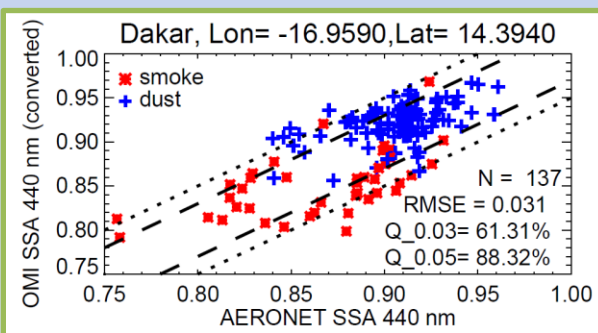

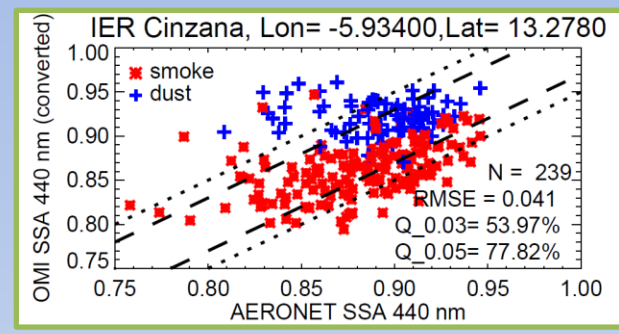

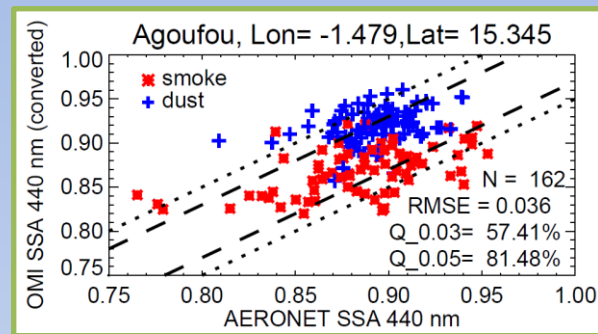

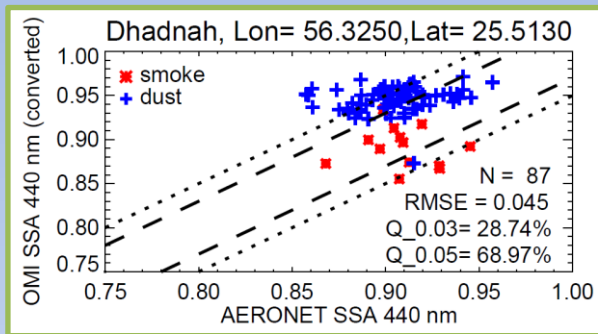

Seasonal Biomass Burning and Dust Sites

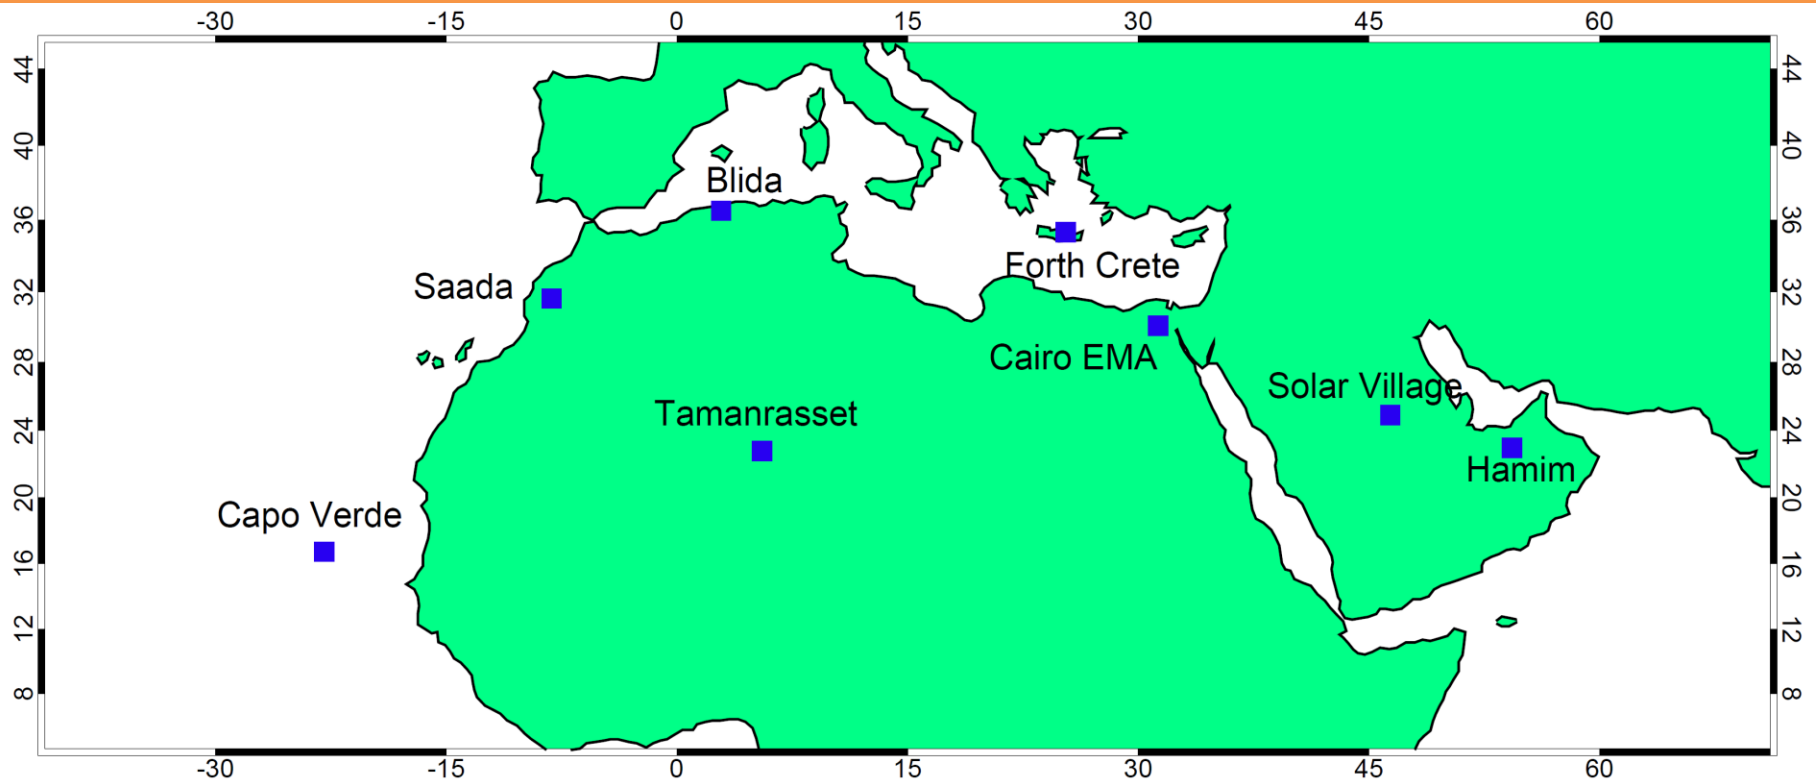

OMI Vs. AERONET

Seasonal Biomass Burning and Dust Sites

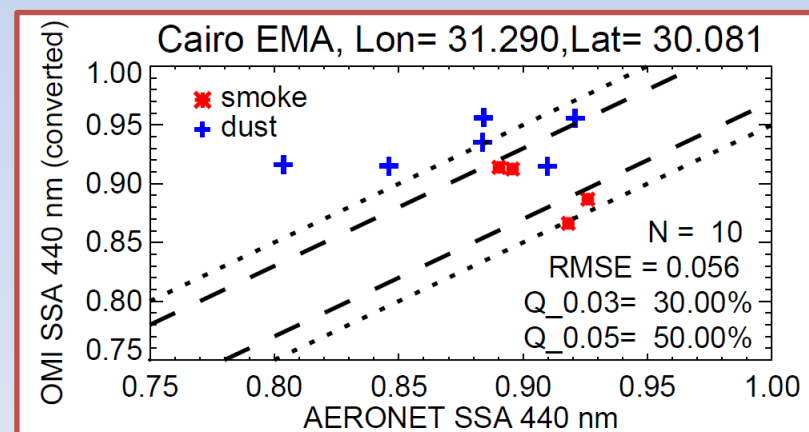

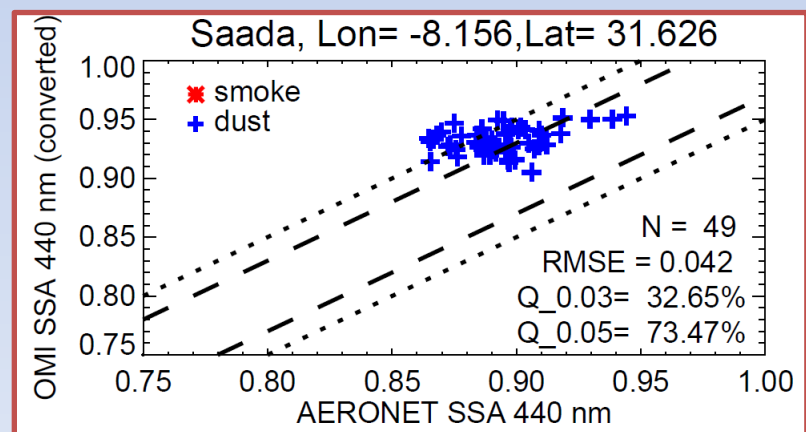

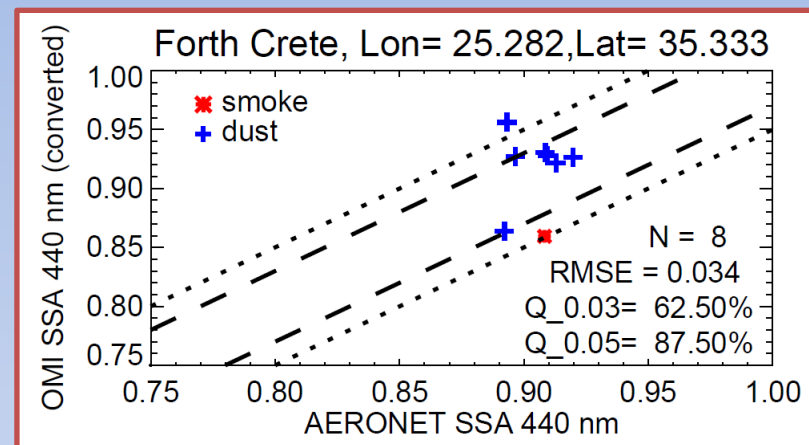

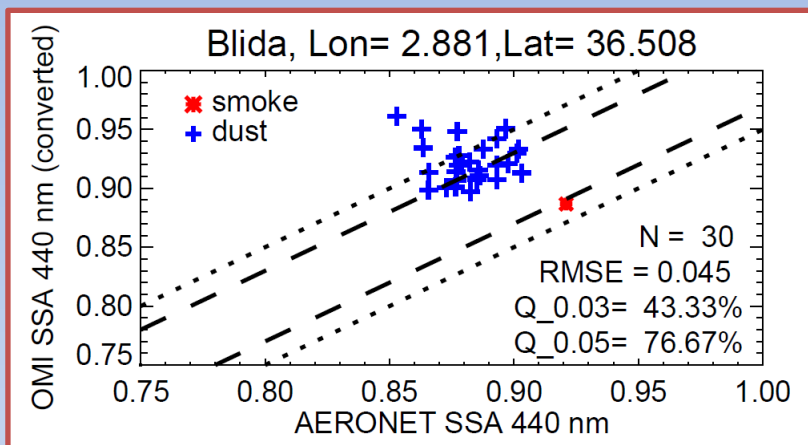

Performance of smoke models appears to be better than dust models

Dust Sites

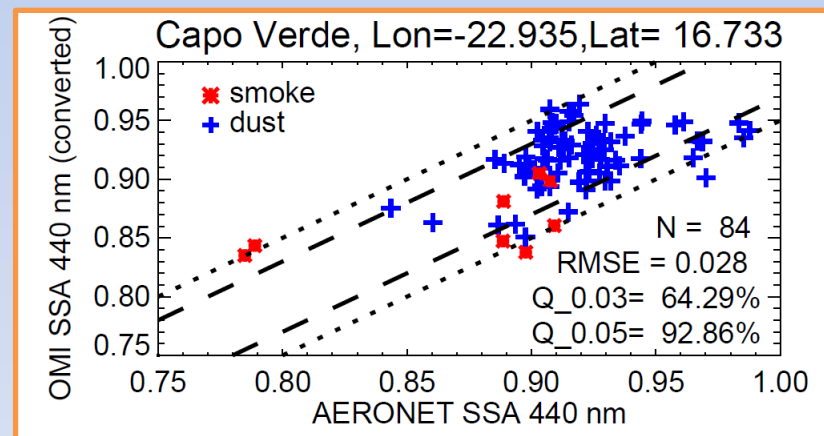

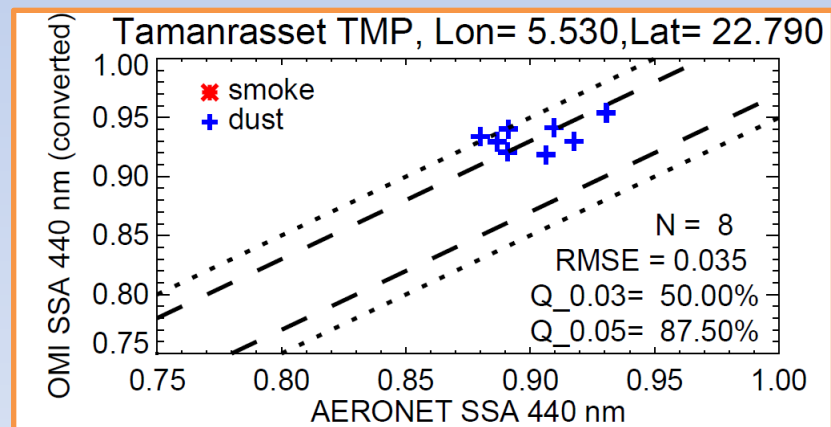

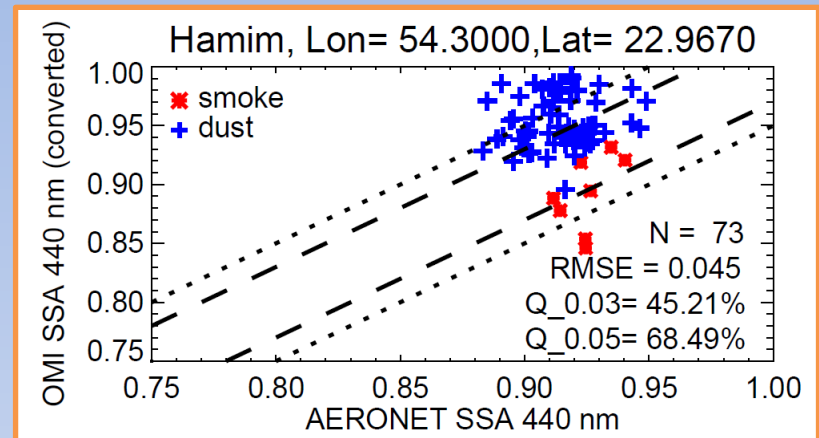

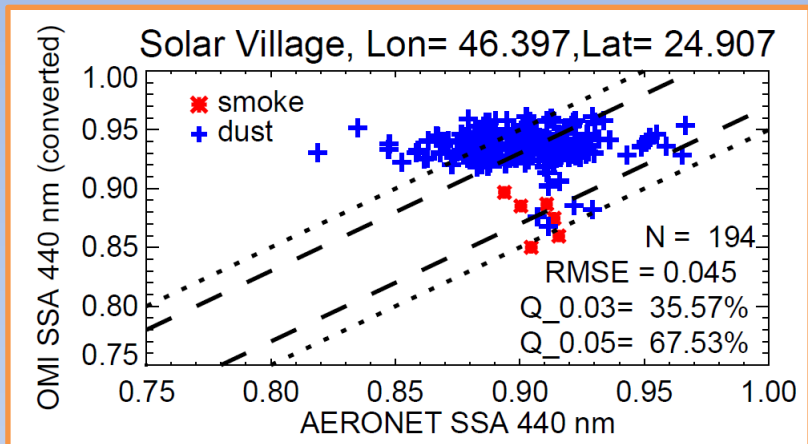

OMI Vs. AERONET

Dust Sites

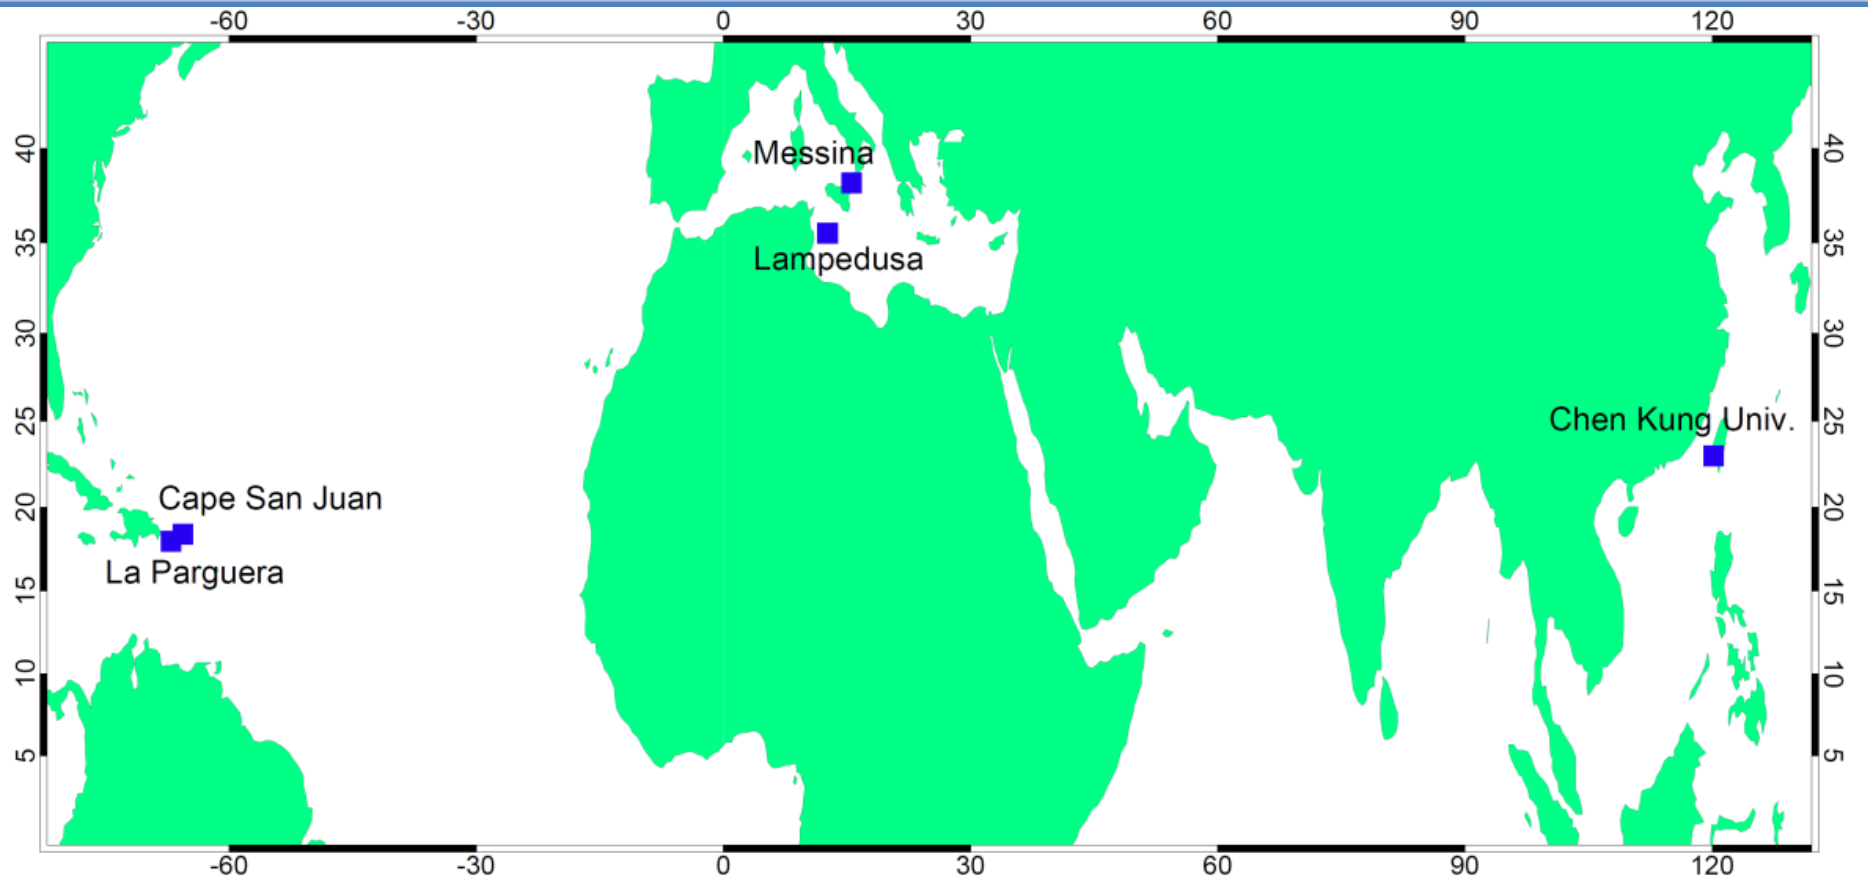

OMI Vs. AERONET Dust Sites

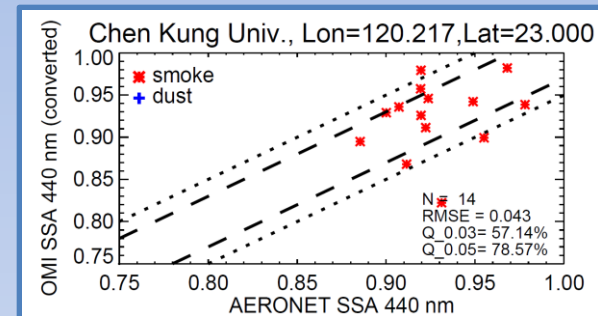

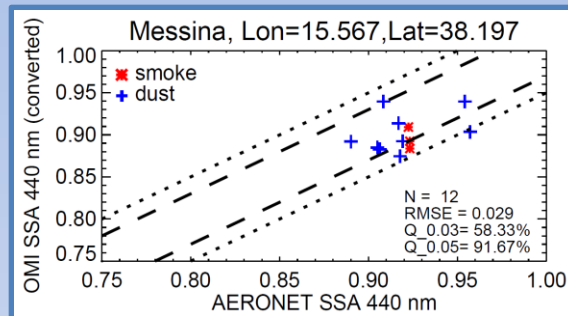

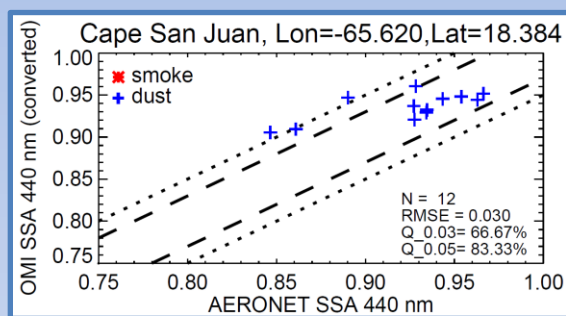

Over-estimation in SSA for more absorbing dust aerosols over LAND
However, good agreement over an oceanic site for the same aerosol type!

Oceanic Sites

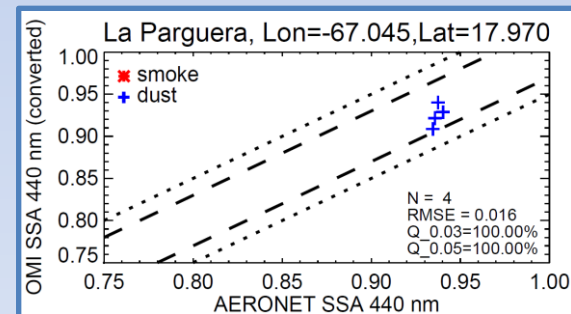

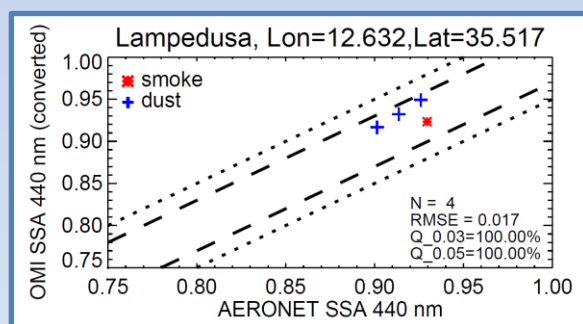

Oceanic Sites OMI Vs. AERONET

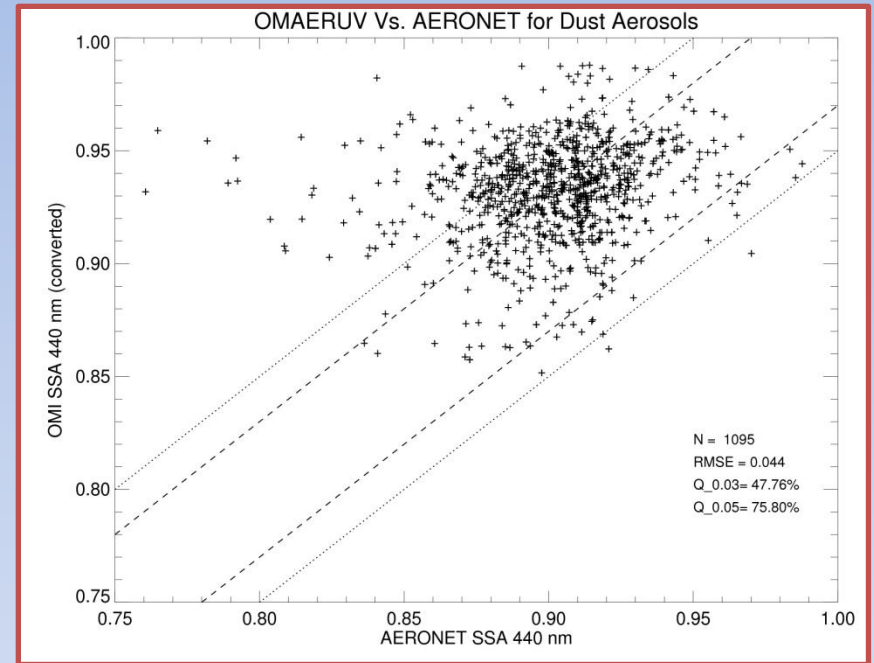

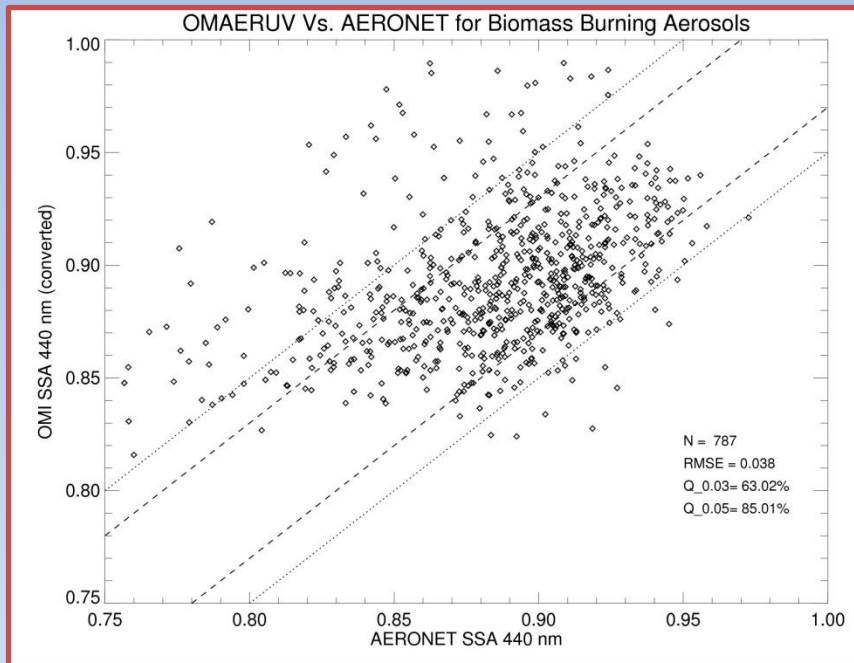

Poor sampling in
co-location

Overall better agreement

Summary Plots

Possible sources of Errors

1. Sub-pixel cloud-contamination

- not likely over desert sites
- in fact retrievals are better over oceanic sites where chances of sub-pixel CC is likely

2. Aerosol layer height

- this assumption is now well constrained by the observed vertical profile of aerosols from CALIOP

3. Surface albedo

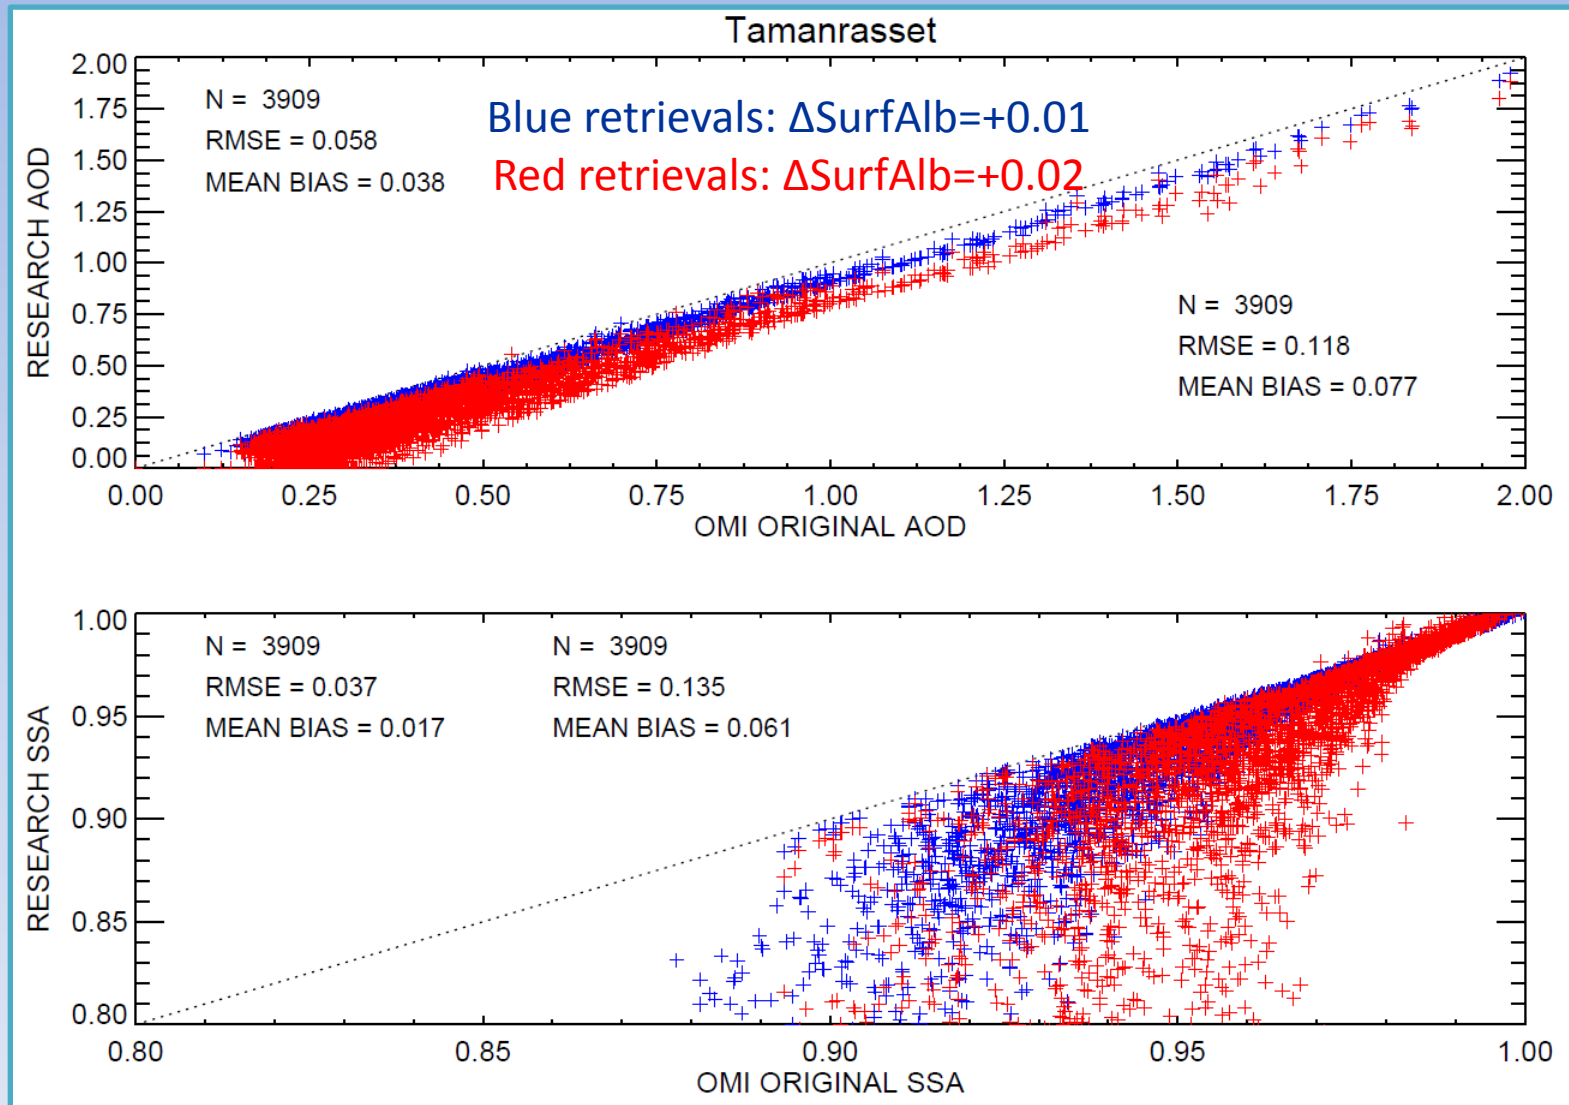

- land-ocean contrast in the quality of retrievals gives a hint on this issue

4. Non-spherical shape of the particles

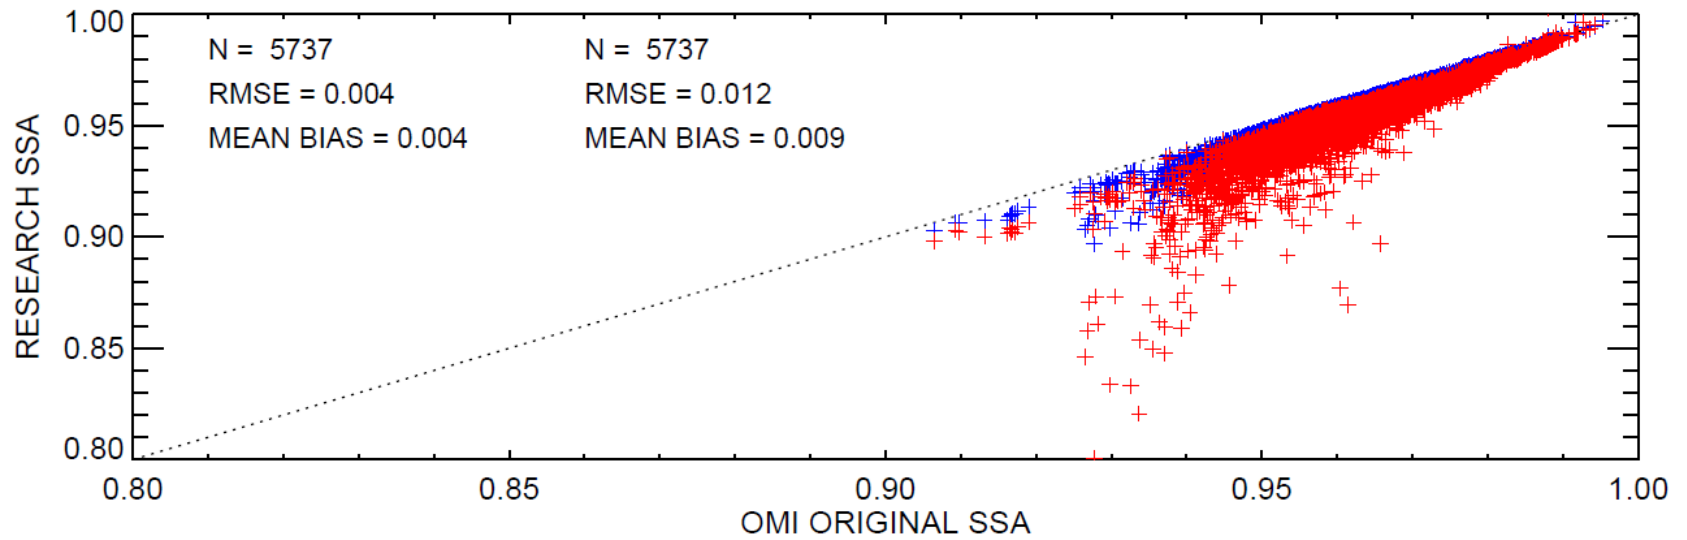

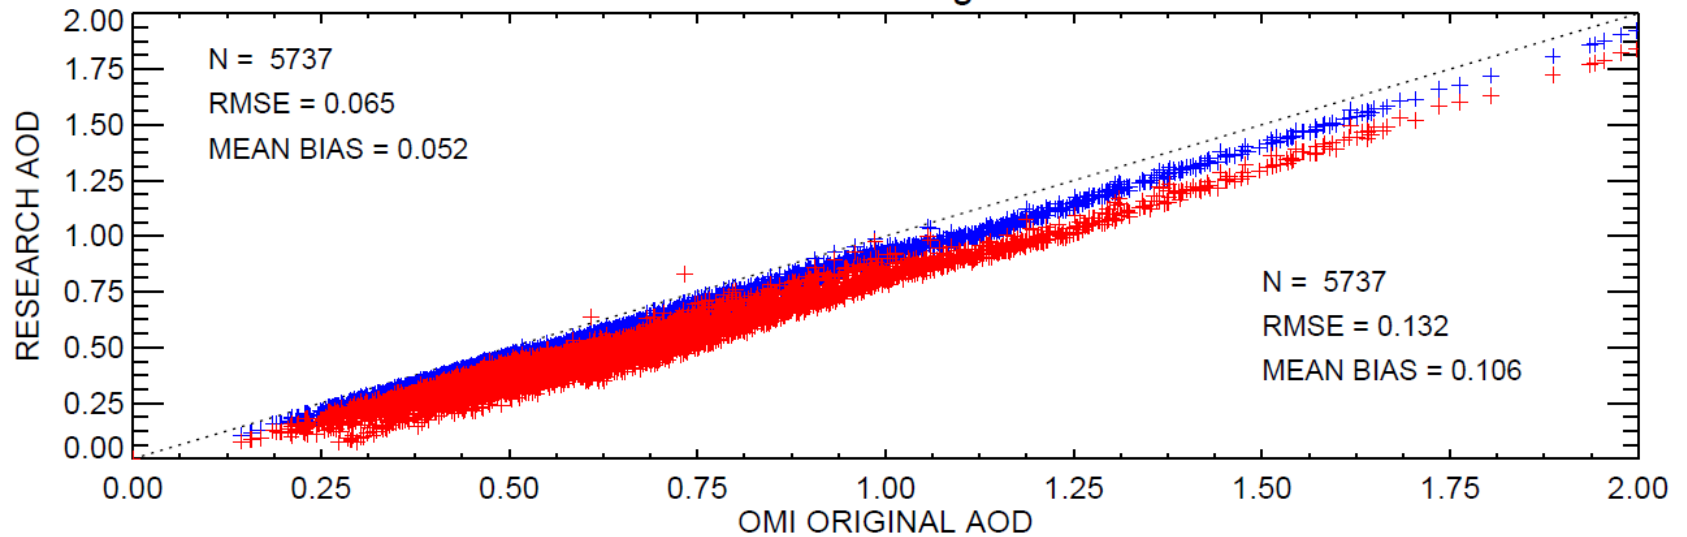

- the non-spherical shape of the dust particles could impact the retrieval through difference in phase function

OMI Vs. AERONET

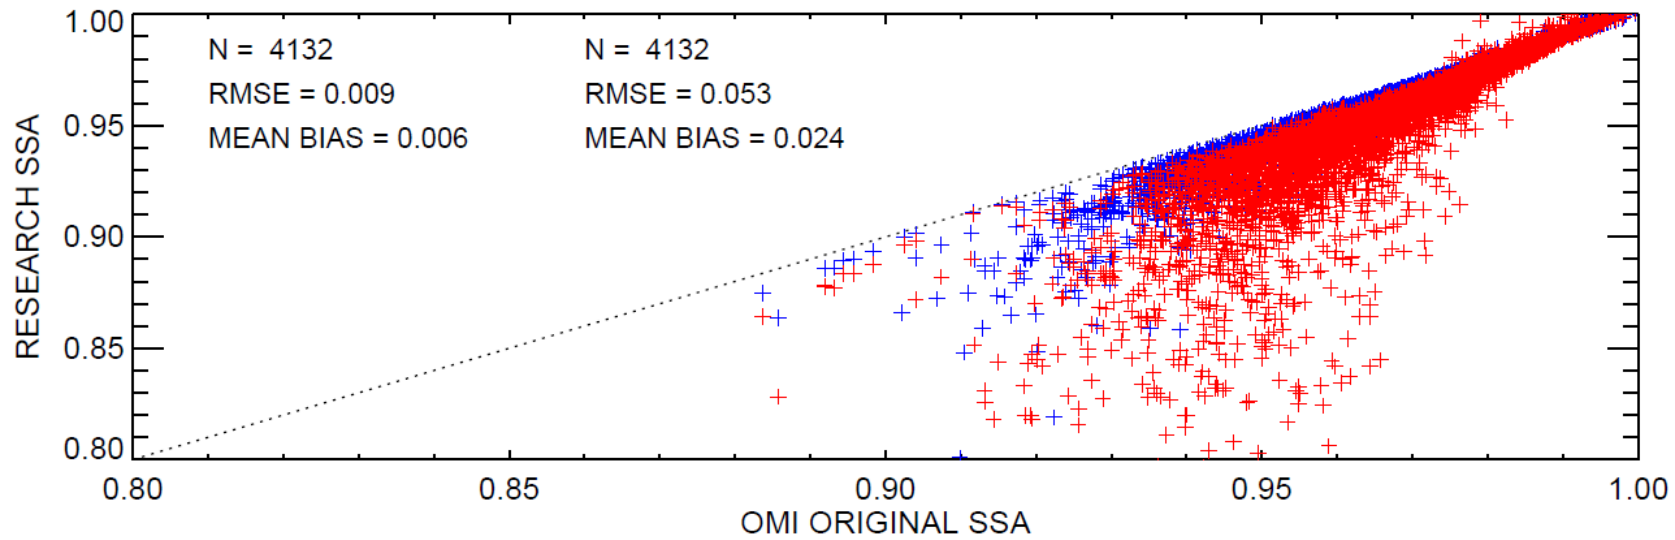

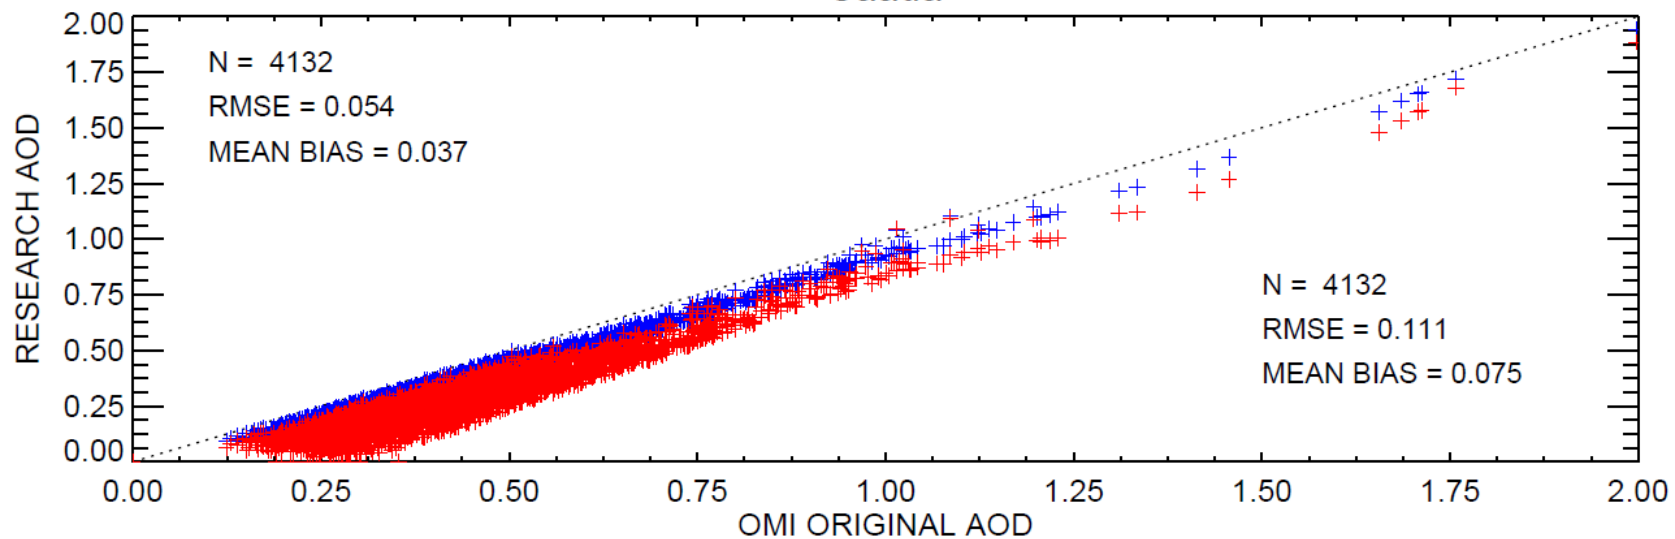

Sensitivity of Retrieval to Change in Surface Albedo

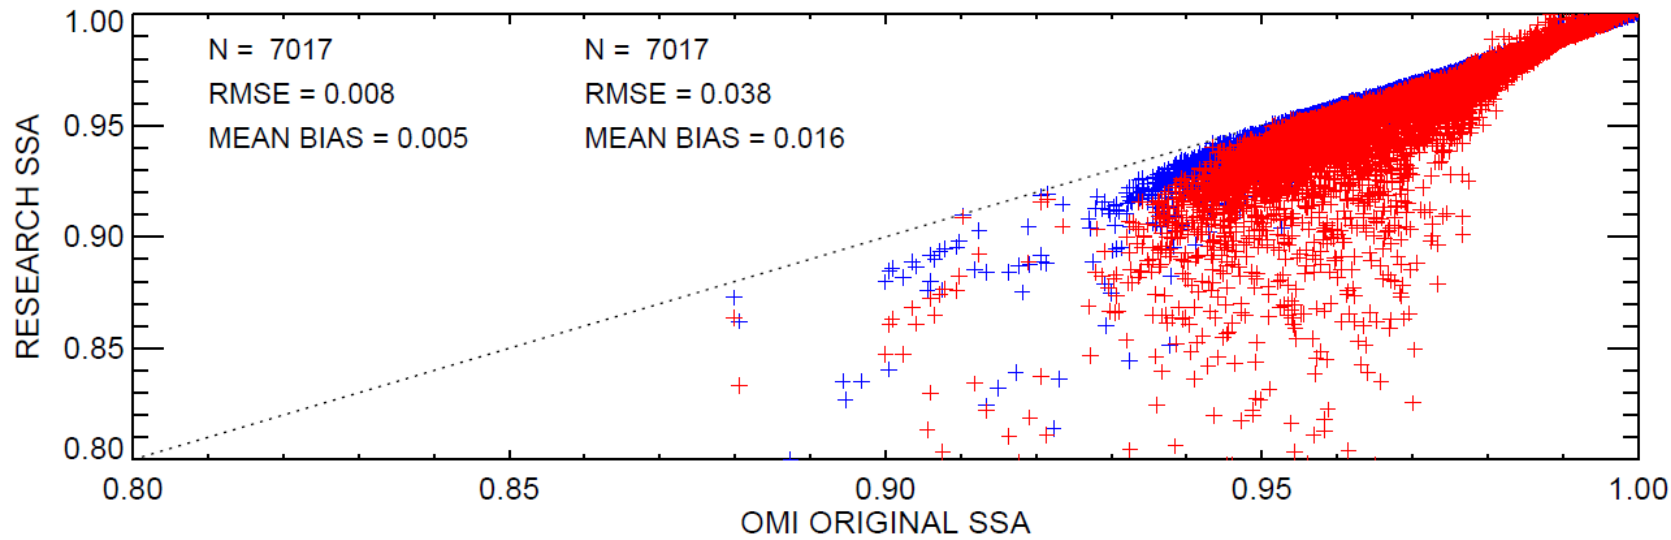

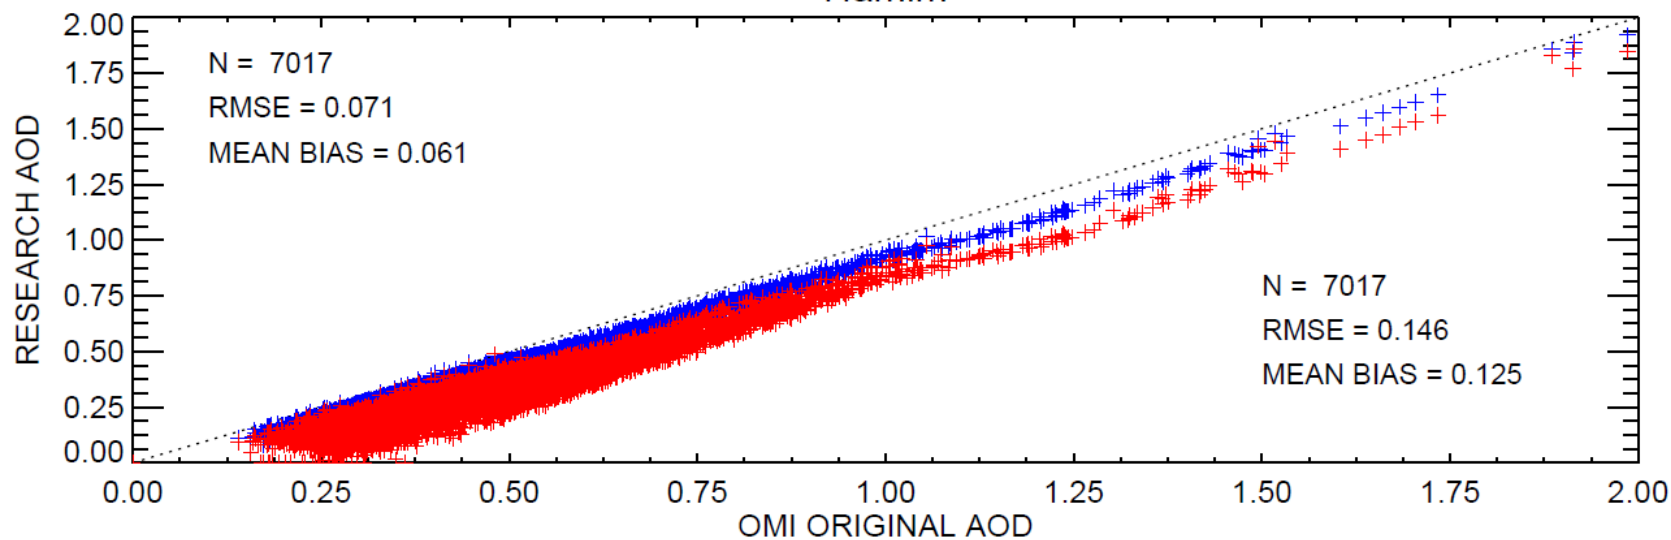

Solar Village

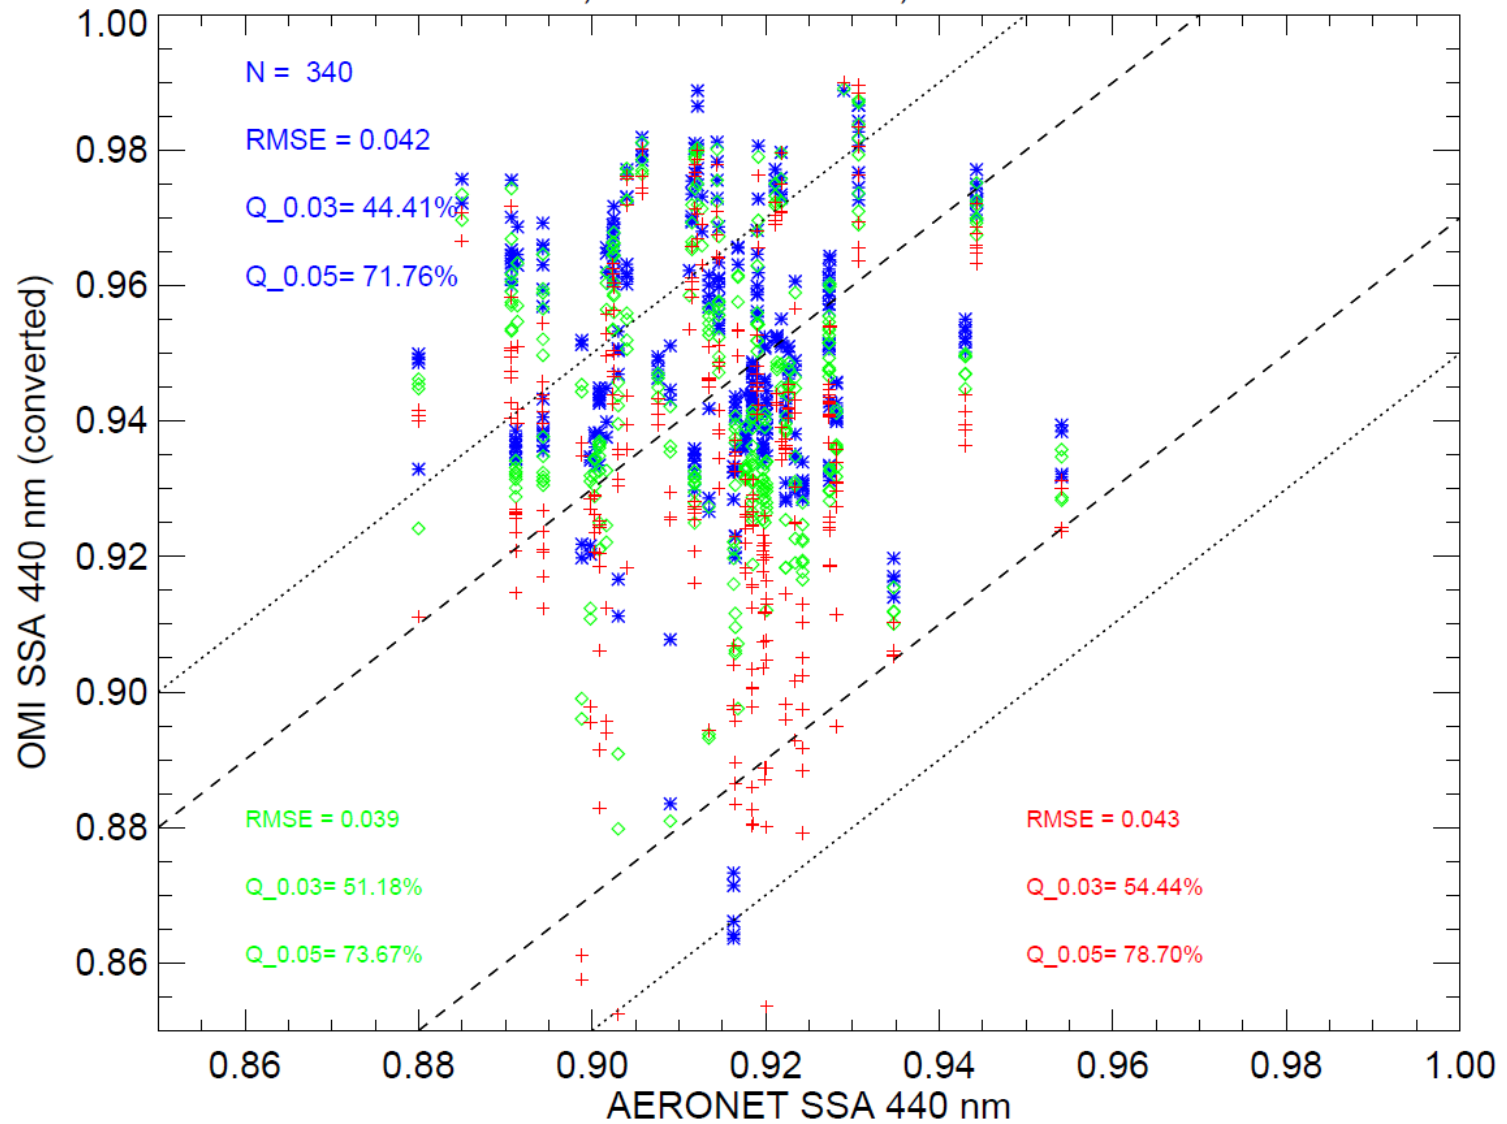

Saada

Hamim, Lon= 54.3000,Lat= 22.9670

Saada, Lon= -8.156, Lat= 31.626

Summary

- We have come up with an updated OMI/OMAERUV aerosol algorithm and resulting re-processed retrieval.
 - ✓ inclusion of organics in carbonaceous models
 - ✓ observed aerosol layer heights from CALIOP
 - ✓ robust identification of aerosol type using AIRS CO and OMI UV-AI data
- The new retrievals have been compared with the **AERONET** direct measurements (AOT) and retrievals (SSA).
- The OMI retrievals of SSA found to be in good agreement over biomass burning sites; about 60-70% retrievals within ± 0.03 uncertainty.
- The dust SSA retrievals are being over-estimated for more absorbing aerosols. The surface albedo assumption and impact of non-spherical shape of the dust particles need to be investigated.

Thanks for your kind attention!
